PORTFOLIO

Rujisaya Kuekool

UX UI DESIGNER

RUJISAYA1002@GMAIL.COM

I am a UX UI designer.

" Mid-level UX/UI Designer with 2+ years of experience in cybersecurity platforms and data-driven dashboards. Specialized in responsive design, prototype testing, and design systems using Figma. Strong background in collaborating with backend developers by creating detailed UI flows that streamline API development and improve cross-team efficiency. Proven ability to deliver intuitive interfaces that enhance workflow productivity. Passionate about designing user-centered solutions for complex systems that balance usability, business goals, and security requirements. ”

Background

Security Pitch Company Limited
UX/UI Designer, 2023-present

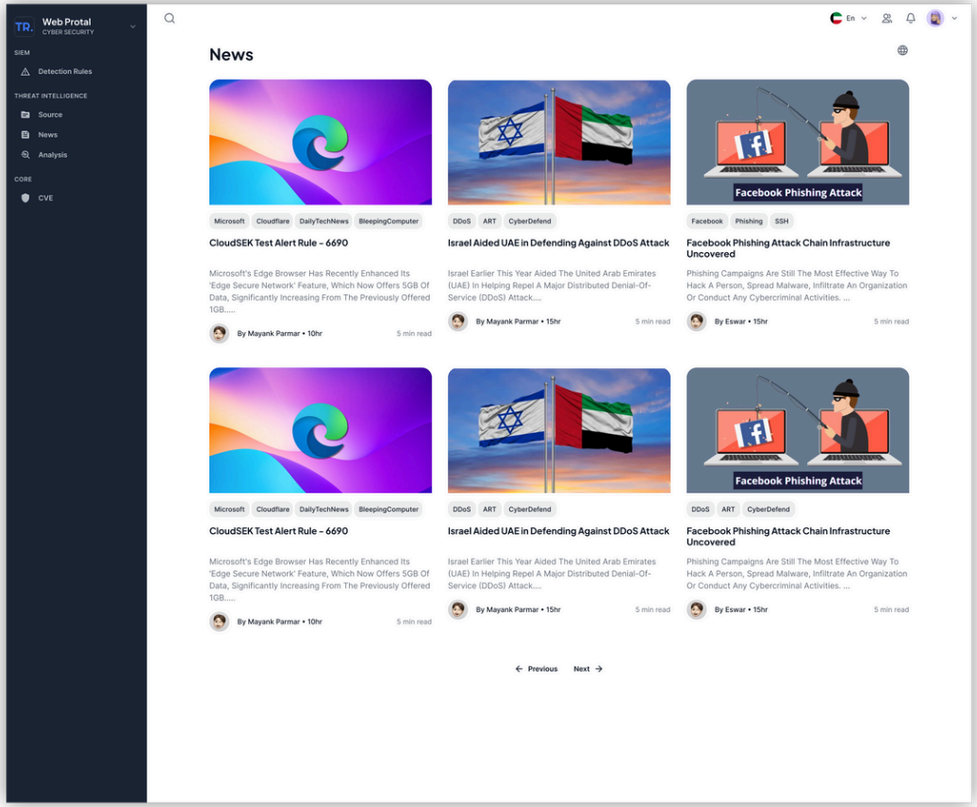

Suan Dusit University, 2019–2023
Bachelor of Information Technology, First Class Honors (GPA: 3.73)

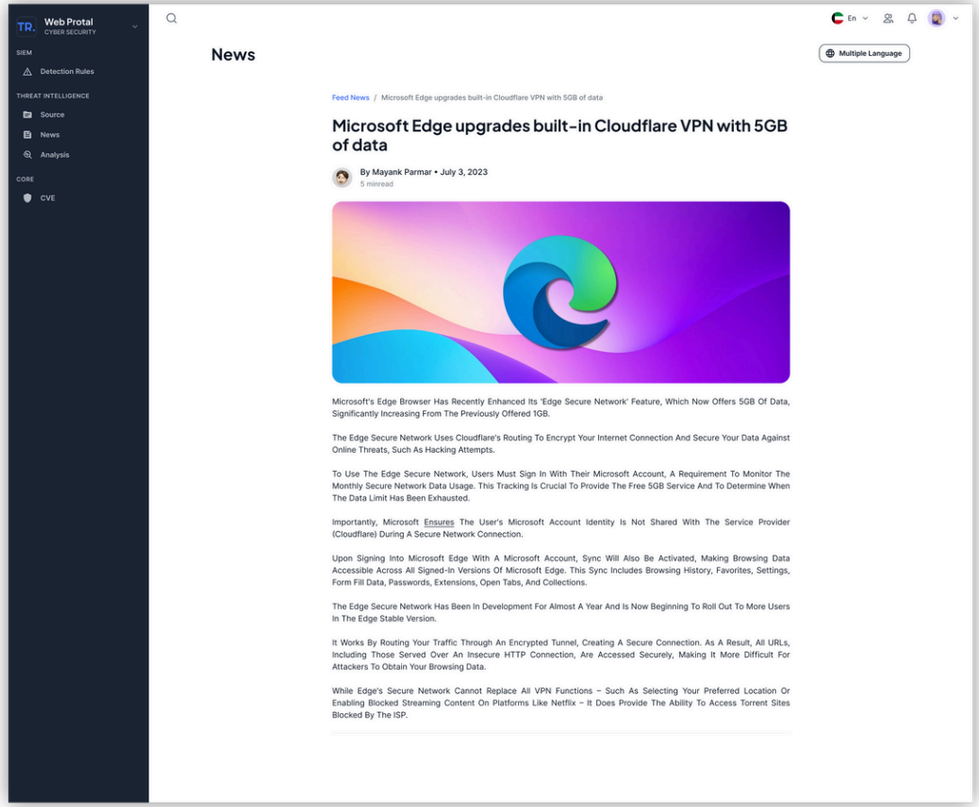

Expertise

- UX/UI Skills: Wireframing, Prototyping, Internal Prototype Testing, Gathering User Feedback
- Design Tools: Figma (Expert), Adobe XD, Photoshop, Illustrator (Basic)
- Technical Knowledge: Creating UI Flows to support API development, Collaboration with Developers, Cybersecurity Basics

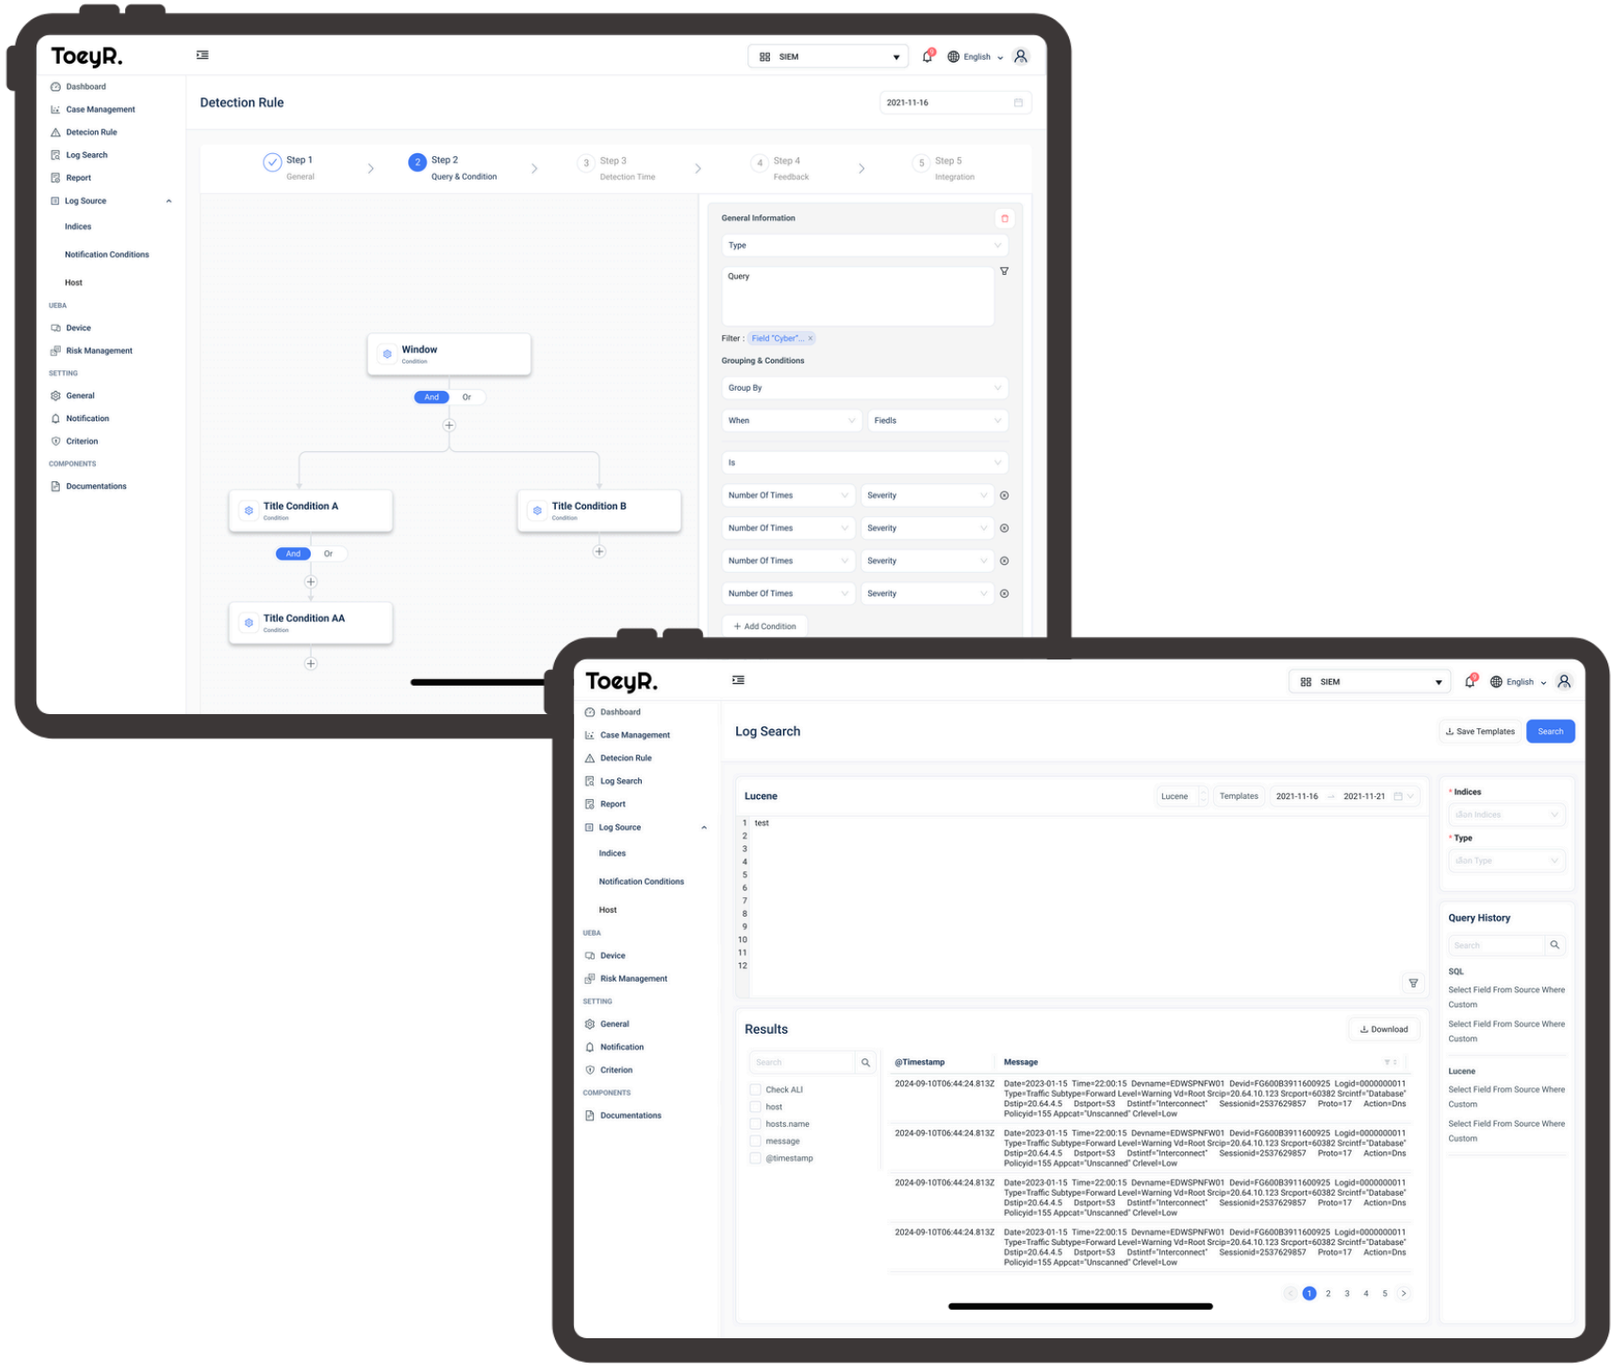

PROJECT

Cybersecurity News

I designed a multilingual backend dashboard that aggregates global cybersecurity news into one streamlined interface. The goal was to create a clear, efficient layout that helps security teams monitor threats in real time across regions and languages.

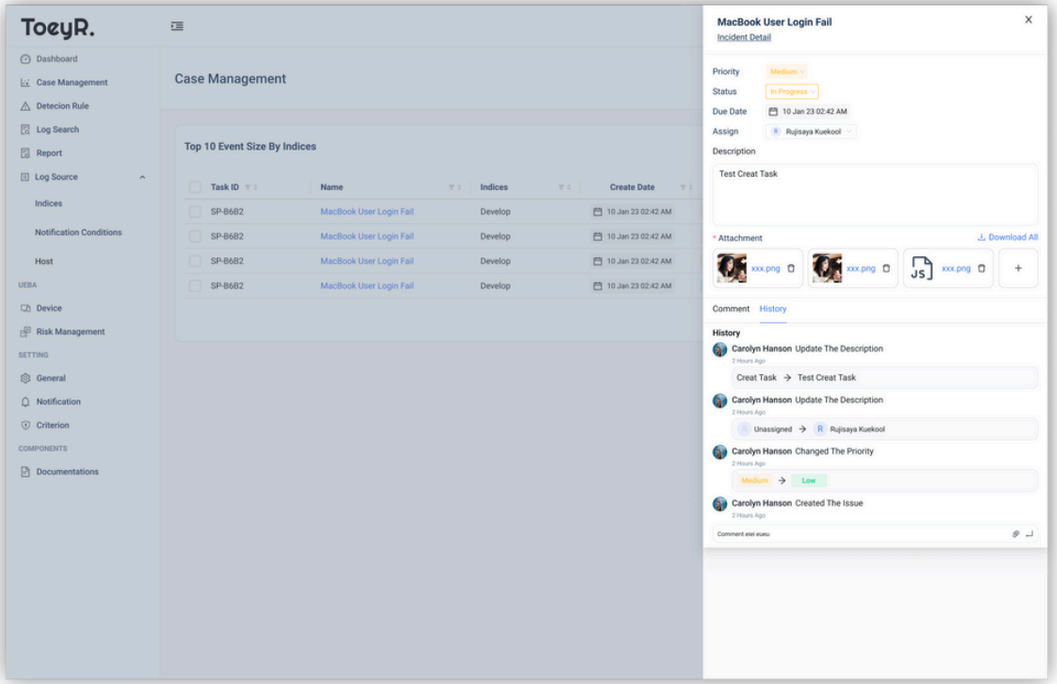

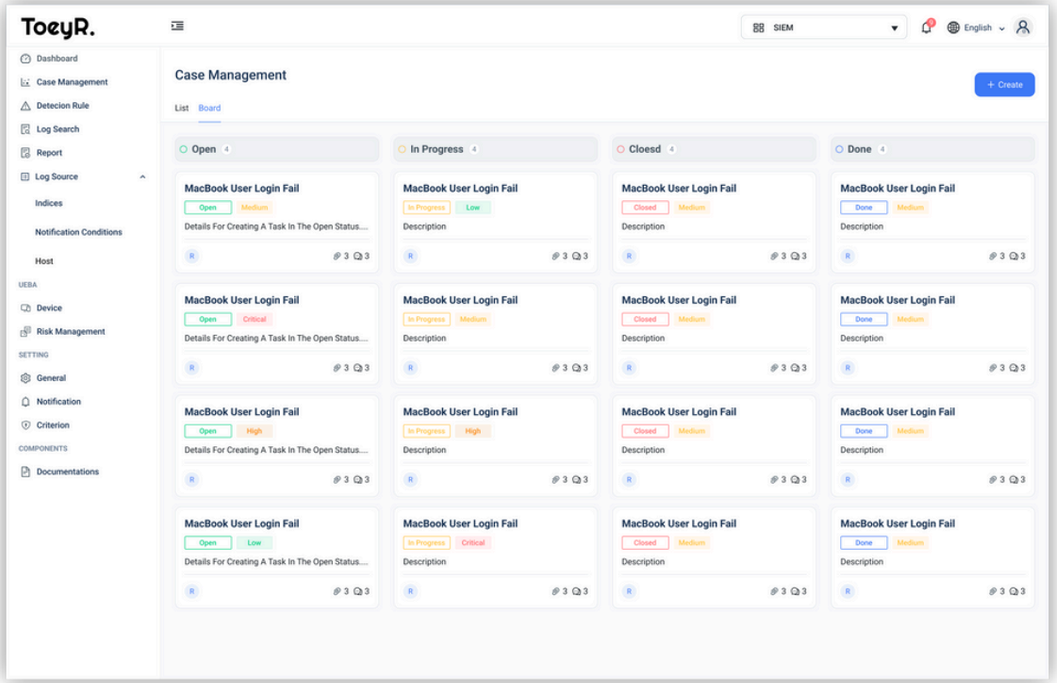

Detection Rule

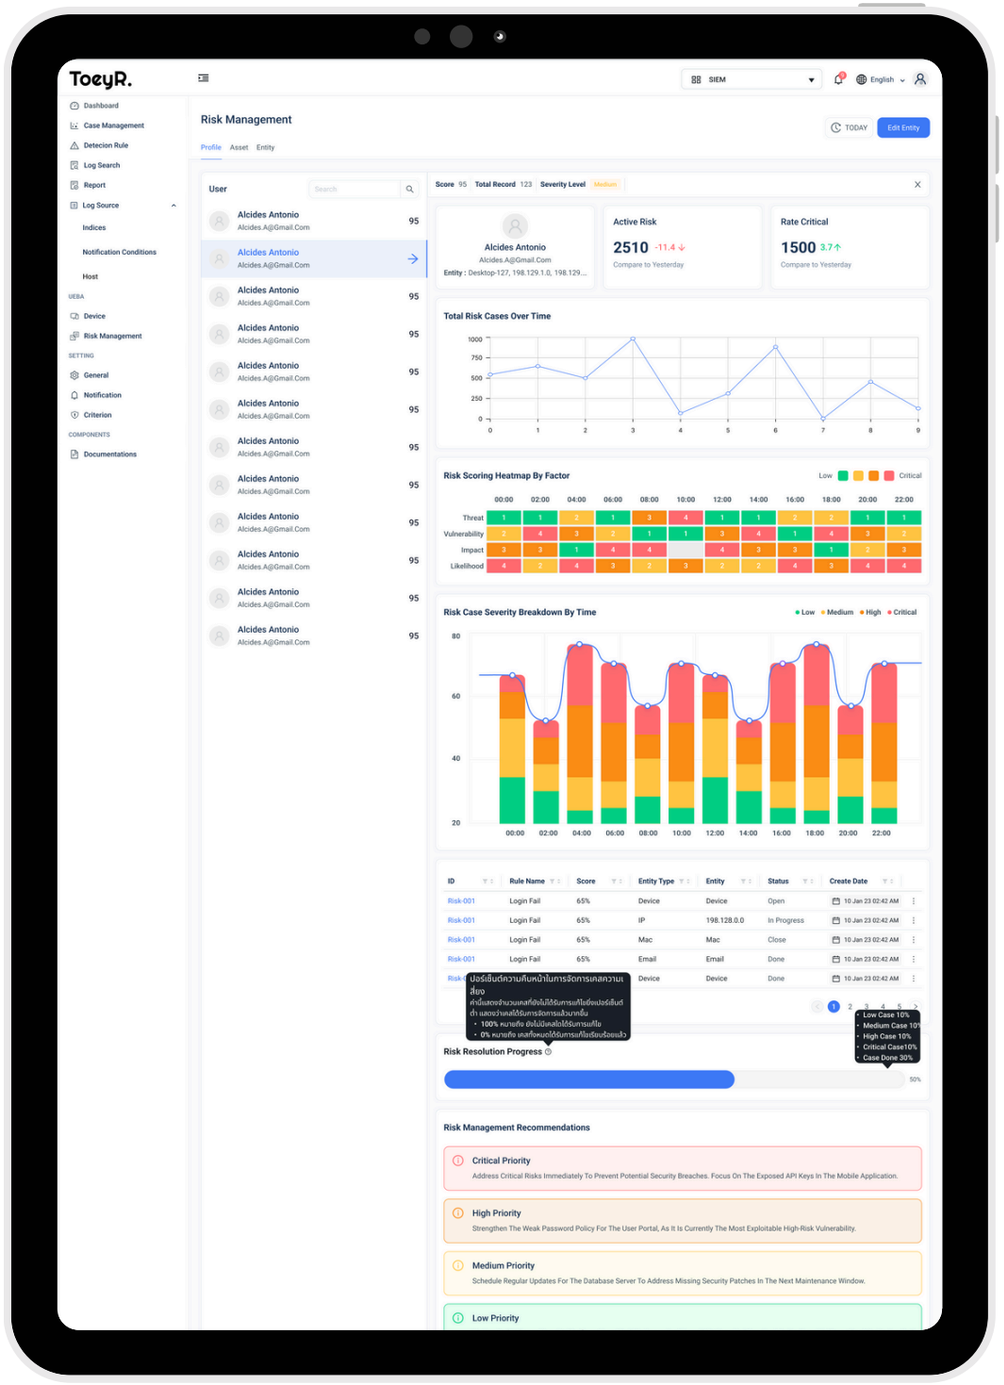

I designed a backend interface for creating detection rules that define what qualifies as abnormal behavior. The system lets users set how many times an event must occur before escalating it to a case, how frequently to scan for anomalies, and how to calculate and assign risk levels automatically.

Case Management

I designed a case management UI for handling abnormal events triggered by detection rules. Users can assign cases to specific team members, set priority levels, leave comments, tag colleagues, view case history, and upload related files — all in one collaborative workspace.

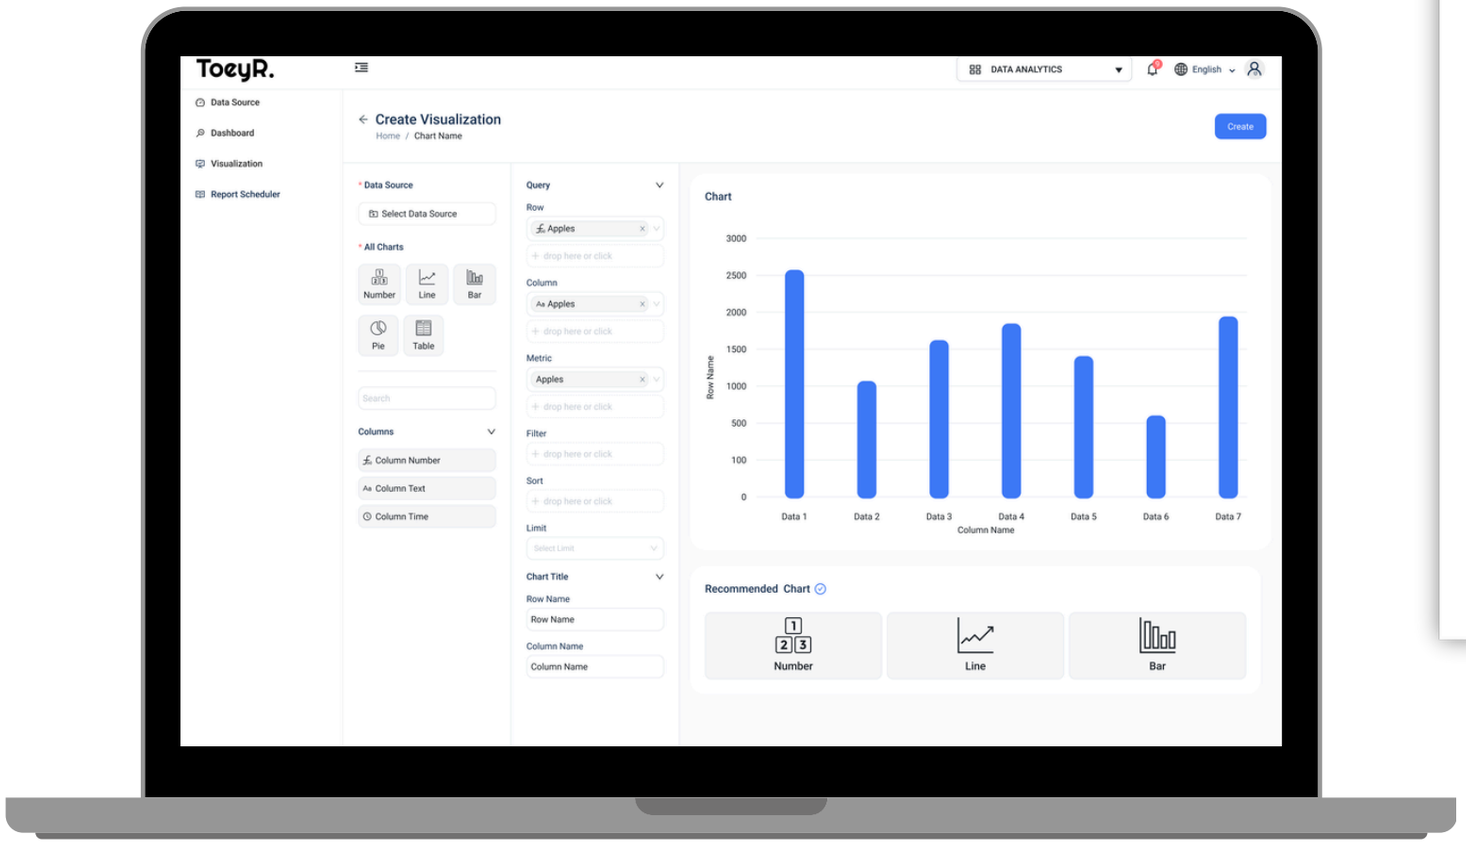

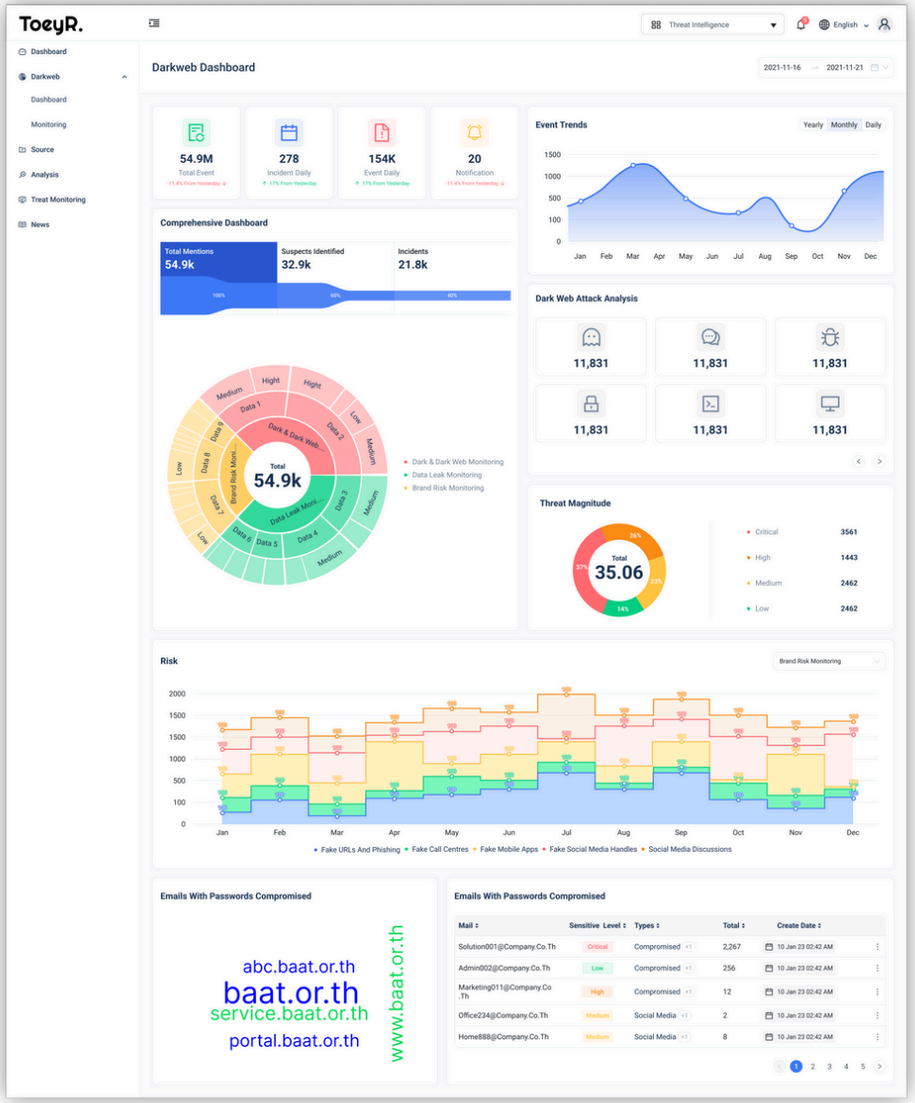

Risk Management

I designed a visual dashboard that summarizes case data across team members. Users can filter cases by time range (3 days, 5 days, 1 week, 1 month), track progress by percentage resolved, compare current case volume with previous periods, and see the severity levels of incoming cases over time.

I designed an interactive dashboard builder that allows users to upload custom datasets and visualize them through configurable charts. Users can select chart types, map data fields, and generate dynamic visualizations for deeper insight and reporting.

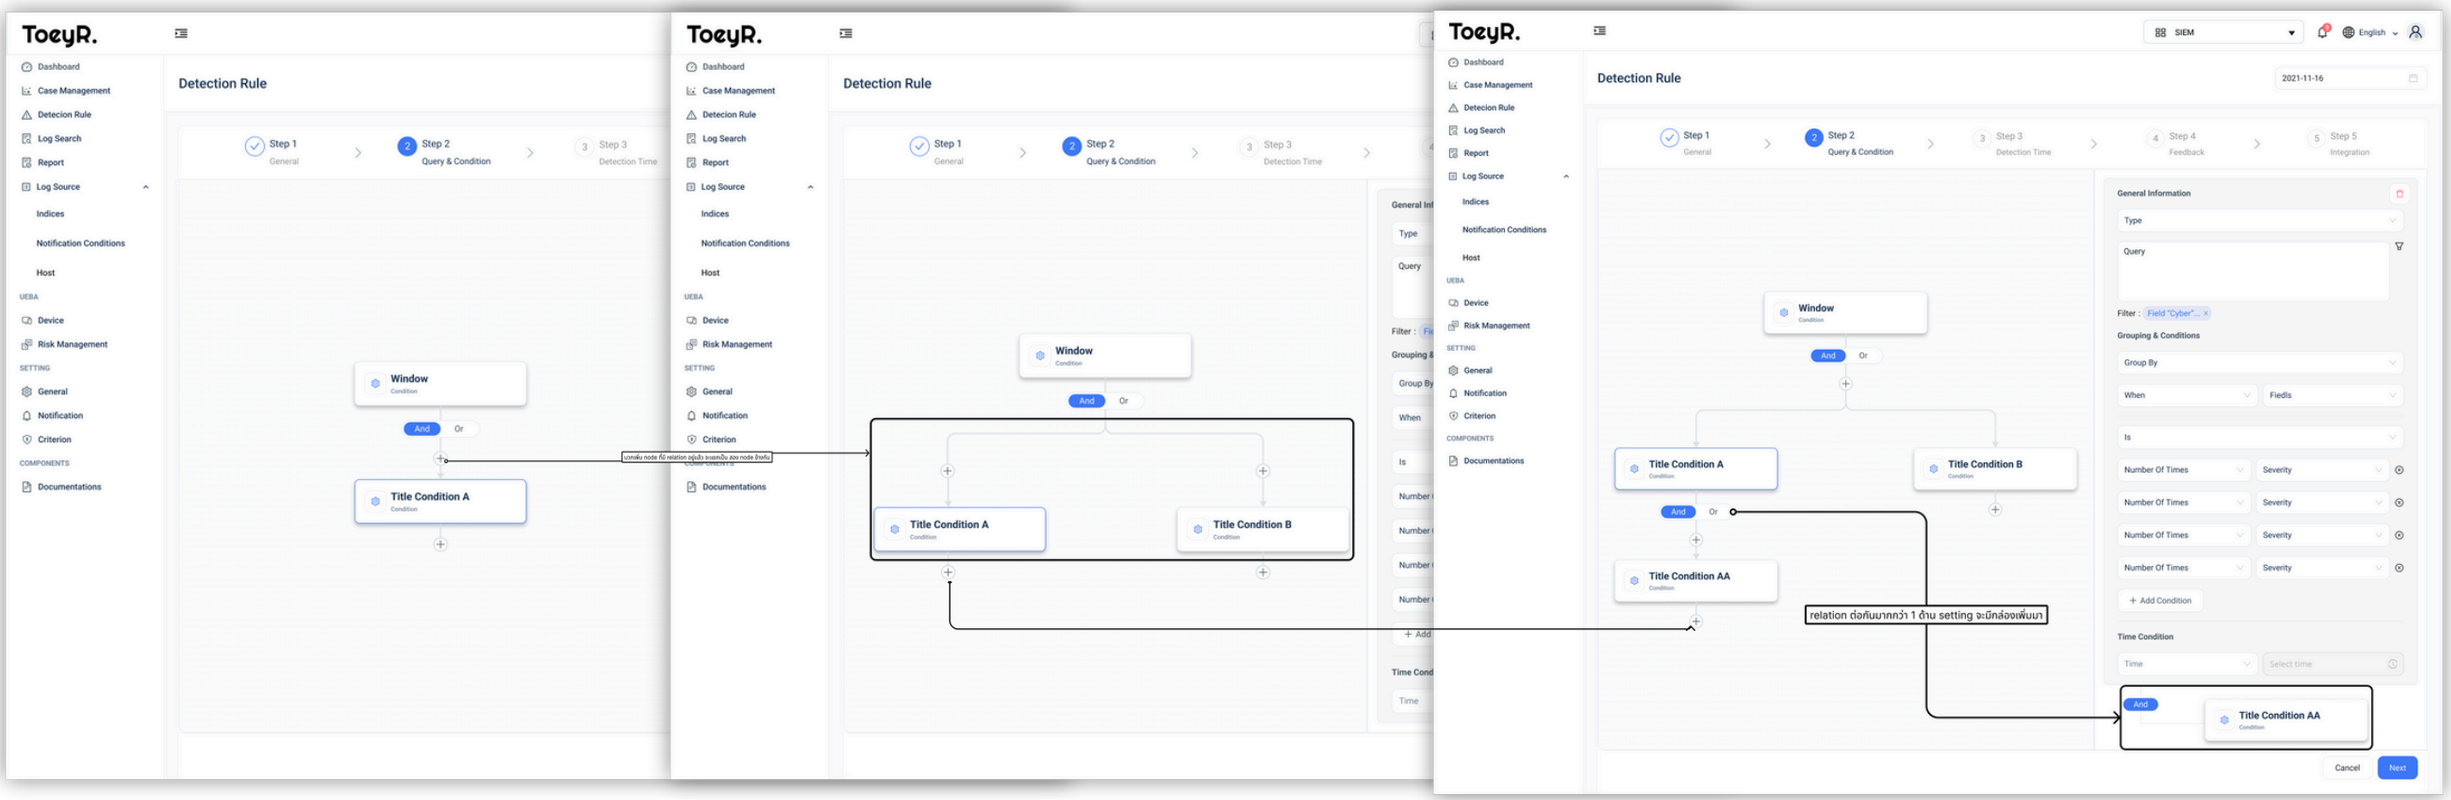

Data Analytics

Case 1 – Detection Rules Setup

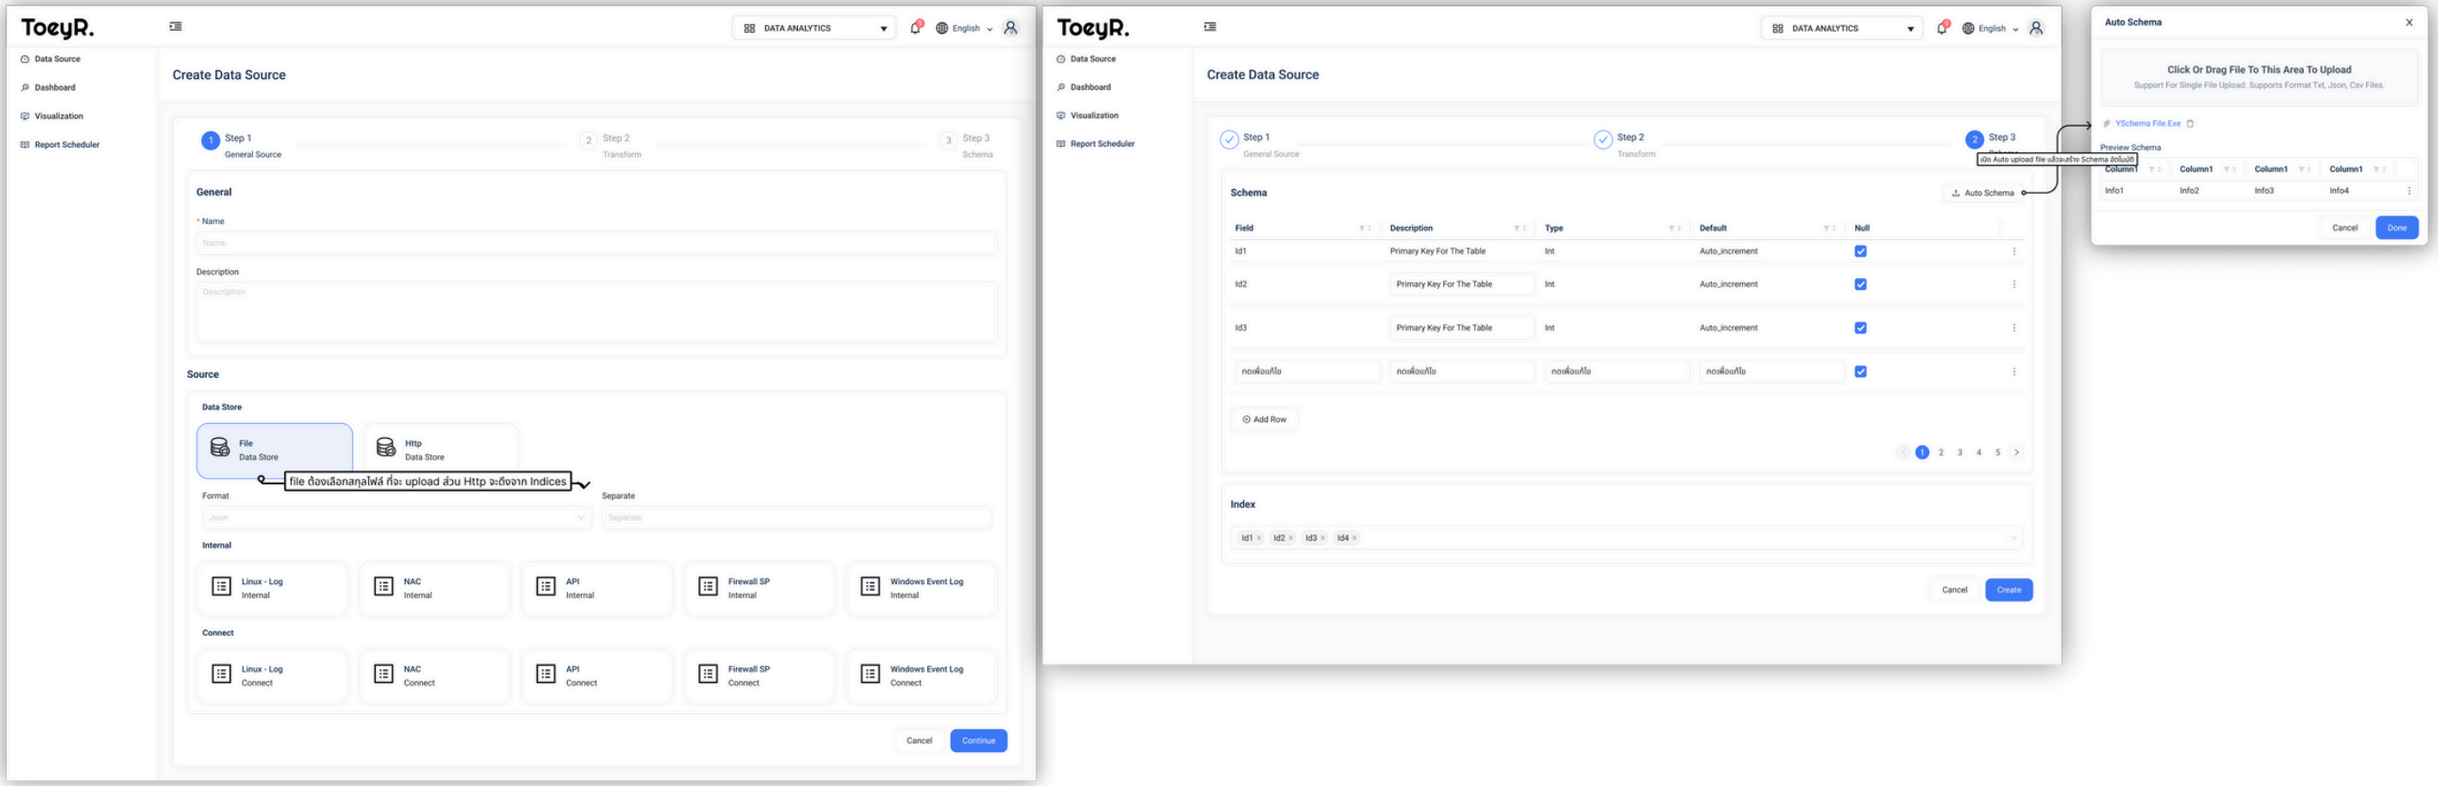

This UX flow demonstrates the setup process of detection rules. Users can define conditions, configure rule logic, and connect actions.

Annotations were added to clarify step-by-step interactions, making it easier for backend developers to understand the workflow and API requirements.

Case 2 – Data Source Creation

This UX flow illustrates how users create a new data source. The system allows file upload and automatically generates schema, reducing manual work.

Annotations explain required inputs and validation steps to ensure smooth backend integration.

I design UX/UI solutions that not only look great but also solve real user problems and drive business results.
